Energy is defined as the capacity to do work. It exists in various forms and can be transferred or transformed from one form to another, but it cannot be created or destroyed, according to the law of conservation of energy.

### 2. Types of Energy Covered in Module 15

- Kinetic Energy: Energy possessed by a moving object.
- Formula:  $KE = \frac{1}{2} m v^2$
- Where:
  - $m$  = mass of the object
  - $v$  = velocity of the object
- Potential Energy: Stored energy based on an object's position or configuration.
- Gravitational potential energy:  $PE = mgh$
- Where:
  - $m$  = mass
  - $g$  = acceleration due to gravity
  - $h$  = height above a reference point
- Thermal Energy: Energy due to temperature, related to the movement of particles.
- Chemical Energy: Stored in chemical bonds, released during reactions.
- Elastic Potential Energy: Stored in stretched or compressed objects like springs or rubber bands.

### 3. Energy Transformation and Conservation

- Energy can transfer from one form to another, such as potential energy converting to kinetic energy.
- The total energy in an isolated system remains constant, illustrating the principle of conservation of energy.

## Work and Power: Key Concepts and Calculations

## 1. Defining Work in Physical Science

Work occurs when a force causes an object to move in the direction of the force.

- Work formula:  $W = F d \cos \theta$
- $F$  = magnitude of the force
- $d$  = displacement
- $\theta$  = angle between force and displacement

Important notes:

- Work is only done when there is displacement in the direction of the applied force.
- If  $\theta = 90^\circ$ , then  $\cos 90^\circ = 0$ , and no work is done regardless of force.

## 2. Power: The Rate of Doing Work

Power measures how quickly work is done.

- Power formula:  $P = \frac{W}{t}$
- $W$  = work done
- $t$  = time taken

Units:

- Watts (W), where 1 watt = 1 joule/second
- Commonly, larger units are used, such as kilowatts (kW)

## 3. Calculations and Applications

- When solving for work or power, ensure units are consistent.
- Example: If a 100 N force moves an object 5 meters in 2 seconds, the work done is  $100 \times 5 = 500$  joules, and the power is  $500/2 = 250$  watts.

## Efficiency and Energy Conservation

### 1. Understanding Efficiency

Efficiency describes how well a machine converts input energy into useful work.

- Efficiency formula: 
$$\text{Efficiency} = \frac{\text{Useful work output}}{\text{Total work input}} \times 100\%$$

Key points:

- No machine is 100% efficient due to energy losses (mainly as heat).
- Improving efficiency involves reducing energy losses.

## 2. Conservation of Energy

This fundamental law states that energy cannot be created or destroyed, only transformed. It underpins all calculations and understanding in Module 15.

Implication:

- In a closed system, the total energy remains constant, but it may change forms (e.g., potential to kinetic).

## Newton's Laws of Motion and Their Relevance

### 1. First Law (Law of Inertia)

An object at rest remains at rest, and an object in motion stays in motion at a constant velocity unless acted upon by an external force.

### 2. Second Law

The acceleration of an object depends on the net force acting upon it and its mass.

- Formula: 
$$F = m a$$
- This law explains how forces affect motion and is critical for understanding how work and energy relate to motion.

### 3. Third Law

For every action, there is an equal and opposite reaction.

## Application of Concepts through Problem-Solving

### Sample Problems and Solutions

- Problem 1: Calculate the kinetic energy of a 10 kg object moving at 15 m/s.
- Solution:  $( KE = \frac{1}{2} \times 10 \times 15^2 = 5 \times 225 = 1125 \text{ joules} )$

- Problem 2: A force of 50 N moves an object 8 meters in 4 seconds. Find the work done and power.

- Solution:
- Work:  $( 50 \times 8 = 400 \text{ joules} )$
- Power:  $( 400/4 = 100 \text{ watts} )$

- Problem 3: Determine the gravitational potential energy of a 5 kg object lifted to a height of 10 meters.

- Solution:  $( PE = 5 \times 9.8 \times 10 = 490 \text{ joules} )$

## Common Misconceptions Clarified

- Work is only done when the force causes displacement in the same direction as the force.

Many students mistakenly think any force applied results in work, but the direction matters.

- Energy is not lost but transformed.

Perpetual energy loss as heat in machines is due to energy transformation, not destruction.

- Higher speed always means higher energy.

Kinetic energy depends on the square of velocity; small increases in velocity result in large increases in kinetic energy.

## Practical Applications and Real-World Examples

- Roller Coasters: Convert potential energy at the top into kinetic energy as they descend, demonstrating energy conservation.
- Car Engines: Convert chemical energy from fuel into mechanical work, illustrating energy transformation and efficiency.
- Pendulums: Exhibit conversion between kinetic and potential energy, illustrating oscillatory motion and energy conservation.
