What is a Limiting Reactant?

In a chemical reaction, the limiting reactant is the substance that is completely consumed first, thus limiting the amount of product that can be formed. Once this reactant runs out, the reaction cannot proceed further, regardless of the quantities of the other reactants present.

Examples & Analogy:

- Think of baking cookies: You have a certain amount of flour and sugar. If you only have enough flour to make 10 cookies but enough sugar for 15, then flour is the limiting reactant because it runs out first, capping the number of cookies you can make.

Why Is It Important?

Typical Content Covered in the Answer Key

The answer key generally includes solutions to:

- Determining limiting reactants given initial quantities.
- Calculating theoretical yields of products.
- Computing remaining excess reactants.
- Explaining reasoning steps clearly.
- Addressing variations in problem scenarios.

Sample Problem and Answer Breakdown

To illustrate how the answer key functions, consider a typical problem:

Problem:

Given 10 grams of hydrogen gas (H_2) and 80 grams of oxygen gas (O_2), determine the limiting reactant and calculate the amount of water (H_2O) produced.

Step-by-step Solution (as in the answer key):

- Write the balanced chemical equation:

- Convert grams to moles:

- For H_2 :

Molar mass = 2 g/mol

Moles of H_2 = 10 g / 2 g/mol = 5 mol

- For O₂:

Molar mass = 32 g/mol

Moles of O₂ = 80 g / 32 g/mol = 2.5 mol

- Determine the molar ratio needed:

According to the balanced equation, 2 mol H₂ reacts with 1 mol O₂.

- Calculate the required amounts:

- For 2.5 mol O₂, required H₂ = 2 mol H₂ / 1 mol O₂ 2.5 mol O₂ = 5 mol H₂

- Compare available and required:

- Available H₂ = 5 mol (matches required)
- Available O₂ = 2.5 mol (matches requirement)

- Identify limiting reactant:

Both reactants are present in the exact ratio needed. Therefore, neither is limiting; the reaction is limited by the smaller amount of reactants. Since both are perfectly matched, the reaction proceeds to produce:

- Moles of H₂O = 2 mol H₂O per 2 mol H₂ (from the balanced equation), so:

Moles of H₂O produced = 2 mol H₂O

- Calculate mass of water produced:

Molar mass of H₂O = 18 g/mol

Mass of $\text{H}_2\text{O} = 2 \text{ mol} \times 18 \text{ g/mol} = 36 \text{ grams}$

Answer:

- Limiting reactant: Both reactants are limiting in this scenario, resulting in complete consumption.
- Water produced: 36 grams

The answer key would confirm these calculations, providing step-by-step reasoning and clarifying any misconceptions.
