Question 1: Which amino acid has a sulfur atom in its side chain?

- A) Serine
- B) Threonine
- C) Methionine
- D) Valine

Answer: C) Methionine

Explanation: Methionine contains a sulfur atom in its side chain, making it unique among the standard amino acids in this regard. Serine and threonine have hydroxyl groups, while valine is a branched-chain amino acid without sulfur. Recognizing this structural feature is essential for understanding amino acid properties and their roles in proteins.

Answer: A) Hexokinase

Explanation: Hexokinase catalyzes the phosphorylation of glucose to produce glucose-6-phosphate, the first step in glycolysis. Phosphofructokinase acts later in the pathway, while pyruvate kinase catalyzes the final step. Aldolase is involved in splitting fructose-1,6-bisphosphate. Recognizing enzyme functions within pathways is crucial for understanding metabolic regulation.

Question 3: Which of the following statements about ATP is correct?

- A) It is a high-energy phosphate compound primarily used in anabolic reactions.
- B) Its hydrolysis releases energy that can be used to drive endergonic processes.

In-Depth Analysis of Typical Review Packet Answers

Let's explore some typical questions and their detailed answers to clarify complex concepts.

- Describe the structure and function of carbohydrates.

Answer Breakdown:

- Structure: Carbohydrates are organic molecules composed of carbon, hydrogen, and oxygen, generally in a 1:2:1 ratio. They include monosaccharides (simple sugars like glucose and fructose), disaccharides (sucrose, lactose), and polysaccharides (starch, glycogen, cellulose).

- Function: They serve as primary energy sources. Monosaccharides are quickly absorbed for energy, while polysaccharides function as energy storage (glycogen in animals, starch in plants) and structural components (cellulose in plant cell walls).

Key Points to Remember:

- The ring structure of sugars in aqueous solutions.
- The difference between alpha and beta glycosidic bonds.
- The significance of polysaccharides? branching patterns.
- Explain the role of enzymes in biochemical reactions. How do factors like pH and temperature influence enzyme activity?

Answer Breakdown:

- Role of Enzymes: Enzymes are biological catalysts that speed up chemical reactions by lowering activation energy, allowing reactions to occur rapidly at physiological conditions.

- Factors Affecting Enzyme Activity:

- pH: Enzymes have an optimal pH range; deviations can denature the enzyme or alter the charge of amino acids in the active site, reducing activity.

- Temperature: Increased temperature accelerates reactions up to a point (the enzyme's optimal temperature). Excess heat can denature enzymes by disrupting their tertiary structure, leading to loss of activity.

Additional Factors:

- Substrate concentration (saturation point)
- Presence of inhibitors (competitive vs. non-competitive)

Tip: Remember the enzyme activity vs. temperature and pH graph, which typically shows a bell-shaped curve.

- Outline the steps of glycolysis and identify the key products.

Answer Breakdown:

- Steps of Glycolysis:

- Hexokinase Reaction: Glucose to glucose-6-phosphate.
- Phosphoglucose Isomerase: Glucose-6-phosphate to fructose-6-phosphate.
- Phosphofructokinase: Fructose-6-phosphate to fructose-1,6-bisphosphate.
- Aldolase: Splits into two three-carbon molecules? dihydroxyacetone phosphate and glyceraldehyde-3-phosphate.
- Glyceraldehyde-3-phosphate Dehydrogenase: Produces NADH and 1,3-bisphosphoglycerate.
- Phosphoglycerate Kinase: Produces ATP.
- Pyruvate Kinase: Produces pyruvate and additional ATP.

- Key Products:

- ATP: Net gain of 2 ATP molecules.
- NADH: 2 molecules per glucose.
- Pyruvate: End product, which can enter the citric acid cycle.

Significance: Glycolysis is the first step in glucose metabolism and occurs in the cytoplasm of all cells.

- Describe the electron transport chain and how it generates ATP.

Answer Breakdown:

- Location: Inner mitochondrial membrane.
- Process:
- NADH and FADH₂ donate electrons to the chain.

- Electrons pass through protein complexes (Complex I-IV).
- The energy released pumps protons from the mitochondrial matrix to the intermembrane space, creating a proton gradient.
- Chemiosmosis: Protons flow back into the matrix via ATP synthase, driving the synthesis of ATP.

- ATP Production:

- Each NADH yields about 2.5 ATP.
- Each FADH₂ yields about 1.5 ATP.
- Overall, about 26-28 ATP molecules are produced per glucose molecule.

Key Concept: The electron transport chain is the primary source of ATP in aerobic respiration.

Tips for Effectively Using Review Packet Answers

- Compare Your Responses: Use the packet answers as a reference to check your understanding, but try to articulate answers in your own words.
- Identify Gaps: Focus on questions where your answers differ significantly from the review packet.
- Create Summary Notes: Summarize each topic in your own words for easier recall.
