MCQs for Portal Hypertension and Answers: An In-Depth Review and Guide

Understanding portal hypertension is crucial for medical students, residents, and healthcare professionals involved in hepatology and gastroenterology. Multiple-choice questions (MCQs) serve as an essential tool for assessing knowledge, preparing for exams, and reinforcing understanding of complex conditions like portal hypertension. This article provides a comprehensive review of MCQs related to portal hypertension, including detailed explanations, key concepts, and answers to help learners grasp the intricacies of this condition.

Overview of Portal Hypertension

Portal hypertension refers to an increase in the blood pressure within the portal venous system, typically exceeding 5 mm Hg above the normal portal pressure of approximately 5-10 mm Hg. It is

most commonly caused by liver cirrhosis but can also result from other conditions affecting portal blood flow or resistance.

Key Features:

- Elevated portal pressure leads to the development of varices, ascites, splenomegaly, and portosystemic shunts.
- The primary pathophysiological mechanism involves increased resistance to portal blood flow, often secondary to structural changes like fibrosis or thrombosis.

Significance of MCQs in Portal Hypertension

MCQs are invaluable in medical education for several reasons:

- Assessment of Knowledge: They test understanding of pathophysiology, clinical features, diagnosis, and management.
- Exam Preparation: MCQs simulate real exam scenarios, especially in competitive exams like USMLE, NEET, or postgraduate assessments.
- Learning Reinforcement: Well-designed questions reinforce key concepts and highlight common pitfalls.
- Self-Assessment: They enable learners to identify knowledge gaps and focus on weak areas.

Commonly Asked MCQs in Portal Hypertension

The MCQs can be broadly categorized based on topics such as etiology, pathophysiology, clinical features, diagnostic investigations, and management strategies.

Etiology and Pathophysiology

Sample MCQ 1:

Which of the following is the most common cause of portal hypertension worldwide?

- A) Hepatitis B virus infection
- B) Alcoholic liver disease
- C) Liver cirrhosis due to hepatitis C

D) Schistosomiasis

Answer: D) Schistosomiasis

Explanation:

While cirrhosis is a common cause in developed countries, schistosomiasis remains a leading cause globally, especially in endemic regions, by causing periportal fibrosis that obstructs portal blood flow.

Sample MCQ 2:

Which of the following best describes the primary mechanism leading to increased portal pressure in cirrhosis?

- A) Increased portal blood flow due to vasodilation
- B) Increased resistance to portal blood flow due to fibrosis and regenerative nodules
- C) Increased systemic blood pressure
- D) Decreased portal vein diameter

Answer: B) Increased resistance to portal blood flow due to fibrosis and regenerative nodules

Explanation:

Cirrhosis causes architectural distortion and fibrosis, which increase resistance in the portal venous system, leading to elevated portal pressure.

Clinical Features and Complications

Sample MCQ 3:

Which of the following is the most common presenting complication of portal hypertension?

- A) Ascites
- B) Esophageal variceal bleeding
- C) Hepatic encephalopathy

D) Splenomegaly

Answer: B) Esophageal variceal bleeding

Explanation:

While ascites and splenomegaly are common features, variceal bleeding remains the most dramatic and life-threatening complication, often presenting as upper GI hemorrhage.

Sample MCQ 4:

A patient with known cirrhosis presents with massive hematemesis. Endoscopy reveals esophageal varices. What is the primary pathophysiological reason for variceal formation?

- A) Increased portal blood flow
- B) Formation of portosystemic collaterals due to increased portal pressure
- C) Decreased hepatic synthesis of clotting factors
- D) Spontaneous rupture of esophageal veins

Answer: B) Formation of portosystemic collaterals due to increased portal pressure

Explanation:

Elevated portal pressure causes the development of collateral pathways, including esophageal varices, to bypass the high-resistance portal system.

Diagnostic Investigations

Sample MCQ 5:

Which of the following is the most accurate non-invasive method to estimate portal pressure?

- A) Hepatic venous pressure gradient (HVPG) measurement
- B) Ultrasound Doppler assessment of portal vein

A) Normal portal vein diameter

B) Collateral formation

C) Decreased spleen size

D) Absence of splenomegaly

Answer: B) Collateral formation

Presence of collaterals and splenomegaly are ultrasound features indicating portal hypertension.

Management Strategies

Sample MCQ 7:

Which of the following is the first-line pharmacological treatment for preventing initial bleeding in patients with esophageal varices?

A) Propranolol (non-selective beta-blocker)

B) Vasopressin

C) Octreotide

D) Antibiotics

Answer: A) Propranolol (non-selective beta-blocker)

Explanation:

Propranolol reduces portal pressure by decreasing cardiac output and splanchnic vasoconstriction, thereby preventing first hemorrhage in high-risk varices.
