- Animals (consumers): Organisms that feed on other living things, including herbivores, carnivores, and omnivores.
- Decomposers: Bacteria and fungi that break down dead organic matter, returning nutrients to the soil.
- Microorganisms: Tiny organisms playing vital roles in nutrient cycling and symbiotic relationships.

Abiotic Factors

Abiotic factors are non-living physical and chemical parts of the environment:

- Sunlight: Provides energy for photosynthesis and influences climate patterns.
- Temperature: Affects metabolic rates and distribution of organisms.

- Soil: Provides nutrients and a habitat for many organisms.
- Air: Contains oxygen for respiration and carbon dioxide for photosynthesis.

Types of Interactions Between Organisms and Their Environment

Organisms interact with their environment in various ways, which can be broadly classified as beneficial, neutral, or harmful.

Beneficial Interactions

Some interactions enhance the survival chances of organisms:

- Mutualism: Both species benefit. Example: Bees pollinating flowers while collecting nectar.
- Commensalism: One species benefits, and the other is unaffected. Example: Barnacles attaching to whales.
