- Apply Punnett square analysis to real-world genetic scenarios

Common Questions in the Chicken Genetics Gizmo and Their Answer Keys

Below, we explore typical questions encountered in the assessment, along with detailed answer explanations to facilitate understanding and correct application of genetic principles.

Question 1: What is the probability that a cross between a heterozygous brown egg-laying hen and a white egg-laying hen will produce brown eggs?

This question examines simple Mendelian inheritance for egg color traits, often controlled by a single gene with dominant and recessive alleles.

- **Parental genotypes:** Heterozygous brown egg-laying hen (Bb) x White egg-laying hen (bb)
- **Punnett square analysis:**

BbbBbbbbbBbbb

From the Punnett square, 2 out of 4 offspring (50%) are heterozygous brown eggs (Bb), which produce brown eggs, while 2 out of 4 are white (bb). Therefore, the probability of obtaining brown eggs is **50%**.

Answer key: 50%

Question 2: If a rooster carrying the dominant allele for feather color (C) mates with a hen that is heterozygous for feather color, what is the chance their offspring will have white feathers?

This question assesses understanding of sex-linked or autosomal dominant/recessive traits.

- **Parental genotypes:** Cc (rooster) x Cc (hen)
- **Punnett square analysis:**

CcCCCCccCccc

In this cross, 1 out of 4 offspring (25%) will have the genotype cc, which results in white feathers if white is recessive. Thus, the chance of white feathers is **25%**.

Answer key: 25%

Question 3: How does the inheritance of comb type (single vs. rose) demonstrate Mendelian ratios?

This question explores trait inheritance patterns, often governed by simple dominant-recessive relationships.

- **Example scenario:** A heterozygous rooster with a single comb (Ss) mates with a heterozygous hen (Ss)

- **Punnett square analysis:**

SsSSSSssSsss

Genotypic ratio: 1 SS : 2 Ss : 1 ss

Phenotypic ratio: 3 single comb : 1 rose comb

This classic Mendelian ratio illustrates how dominant and recessive alleles influence trait inheritance.

Answer key: The ratio of 3:1 in phenotypes reflects Mendelian inheritance of a single gene with complete dominance.
