Question What are the main types of conic sections covered in Unit 5 of the test? The main types include circles, ellipses, parabolas, and hyperbolas, each defined by their unique equations and geometric properties. How do you identify the conic section from its general quadratic equation? By analyzing the coefficients of the quadratic terms: if the coefficients of x^2 and y^2 are equal and positive, it's a circle; if they are equal but with different signs, it's a hyperbola; if only one variable has a quadratic term, it's a parabola; and if the coefficients are unequal and positive, it's an ellipse. What is the significance of the focus and directrix in conic sections? Foci and directrices are key to defining conic sections: a parabola is the set of points equidistant from the focus and directrix; ellipses and hyperbolas involve distances to two foci, which determine their shape and properties. How do you find the equation of a parabola given its vertex and focus? Use the distance between the focus and vertex to determine the parabola's orientation and the standard form equation. For a parabola opening upward with vertex at (h, k) and focus at $(h, k + p)$, the equation is $(x - h)^2 = 4p(y - k)$. What are the key steps to graph a hyperbola from its standard equation? Identify the center, vertices, foci, and asymptotes from the equation. Plot the center, draw the vertices, sketch the asymptotes, and then graph the hyperbola's branches accordingly. How do the axes of symmetry relate to conic sections? Each conic section has lines of symmetry: for circles and ellipses, they pass through the foci or center; for parabolas, the axis of symmetry passes through the vertex and focus; for hyperbolas, the axes pass through the foci and vertices. What is the difference between a horizontal and vertical hyperbola? A horizontal hyperbola opens left and right, with the transverse axis along the x-axis, described by $(x-h)^2/a^2 - (y-k)^2/b^2 = 1$. A vertical hyperbola opens up and down, with the transverse axis along the y-axis, described by $(y-k)^2/a^2 - (x-h)^2/b^2 = 1$. What strategies can help efficiently solve conic section problems on the test? Start by identifying the conic type from the equation, write it in standard form if needed, locate key features like vertices, foci, and axes, and use symmetry and known properties to simplify calculations and graphing.
