A block of mass 5 kg slides down an inclined plane of length 10 meters at an angle of 30° .

Assuming friction is negligible, find the acceleration of the block.

Worked Solution:

- Identify knowns:

- Mass, $(m = 5, \text{kg})$

$[$

$$F_g = mg \sin \theta$$

$]$

where $(g = 9.8, \text{m/s}^2)$.

- Calculate the force:

$[$

$$F_g = 5 \times 9.8 \times \sin 30^\circ = 5 \times 9.8 \times 0.5 = 24.5, \text{N}$$

$]$

- Apply Newton's second law:

$[$

$$F = ma \Rightarrow a = \frac{F_g}{m} = \frac{24.5}{5} = 4.9, \text{m/s}^2$$

$$\sqrt{}$$

M1 june 2013 edexcel question student room

m1 june 2013 edexcel question student room is a frequently discussed topic among students preparing for Edexcel Mathematics modules, particularly in the Mechanics 1 (M1) paper. This specific exam question from June 2013 has garnered significant attention due to its challenging nature and the insights it offers into the examiners' expectations. Understanding this question thoroughly can greatly enhance students' problem-solving skills, boost confidence, and improve overall exam performance. In this comprehensive guide, we delve into the details of the M1 June 2013 Edexcel question, analyze its components, provide step-by-step solutions, and offer strategic tips for mastering similar problems in mechanics.

Understanding the M1 June 2013 Edexcel Question

The M1 June 2013 Edexcel question is a classic example used in many revision sessions and practice exams. It tests core concepts such as forces, motion, and Newton's laws, which form the foundation of mechanics. To effectively tackle this question, students must be familiar with key principles, problem-solving techniques, and common pitfalls.

Question Overview

While the exact wording of the original question can vary, the typical M1 June 2013 problem involves a particle moving under the influence of forces, often involving:

- A particle moving along a straight line or on a surface
- Given velocity or acceleration data
- Applying Newton's second law ($F = ma$)

- Using kinematic equations
- Drawing free-body diagrams

For context, here is a typical scenario modeled after the June 2013 question:

A particle of mass m is moving along a horizontal surface. The particle is initially at rest and is acted upon by a force $F(t)$, where F is a function of time t . The force is given by $F(t) = k(10 - t)$, where k is a constant. The particle moves over the surface for 10 seconds. Find the total displacement of the particle during this time.

This type of problem requires students to understand how to translate force functions into acceleration, integrate to find velocity, and then displacement.

Key Concepts and Principles in the M1 June 2013 Question

To solve the M1 June 2013 Edexcel question effectively, students must have a firm grasp of several core mechanics concepts:

1. Newton's Second Law ($F = ma$)

- The fundamental principle linking force, mass, and acceleration.
- In problems where force varies with time, integrate or differentiate as needed.

2. Kinematic Equations

- Used for calculating displacement and velocity when acceleration is known or varies with time.
- Particularly useful when acceleration is a function of time or other variables.

3. Integration and Differentiation

- To find velocity from acceleration: $v(t) = v(0) + \int a(t) dt$
- To find displacement from velocity: $s(t) = s(0) + \int v(t) dt$

4. Free-Body Diagrams

- Visual tools that help clarify the forces acting on the particle.
- Essential for understanding the problem setup and ensuring correct application of Newton's

laws.

5. Boundary Conditions and Initial Values

- Initial velocity, initial position, and the time intervals involved are critical for accurate calculations.

Step-by-Step Solution Strategy for the June 2013 M1 Question

A systematic approach is key to solving the problem efficiently and accurately. Here's a structured method:

Step 1: Identify and Express the Force

- Write down the given force function, e.g., $F(t) = k(10 - t)$.
- Confirm the units and constants involved.

Step 2: Apply Newton's Second Law

- Use $F(t) = m a(t)$ to find the acceleration:

$$[$$

$$a(t) = \frac{F(t)}{m} = \frac{k(10 - t)}{m}$$

$$]$$

- Note if any initial acceleration or velocity is given.

Step 3: Integrate Acceleration to Find Velocity

- Assuming the particle starts from rest ($v(0) = 0$), integrate:

$$[$$

$$v(t) = \int_0^t a(s) \, ds = \int_0^t \frac{k(10 - s)}{m} \, ds$$

\]

- Carry out the integral:

\[

$$v(t) = \frac{k}{m} \left[10s - \frac{s^2}{2} \right]_0^t = \frac{k}{m} \left(10t - \frac{t^2}{2} \right)$$

\]

Step 4: Integrate Velocity to Find Displacement

- Starting from initial position $(s(0) = 0)$:

\[

$$s(t) = \int_0^t v(s) \, ds$$

\]

- Substitute $(v(s))$:

\[

$$s(t) = \int_0^t \frac{k}{m} \left(10s - \frac{s^2}{2} \right) \, ds$$

\]

- Perform the integral:

\[

$$s(t) = \frac{k}{m} \left[5s^2 - \frac{s^3}{6} \right]_0^t = \frac{k}{m} \left(5t^2 - \frac{t^3}{6} \right)$$

\]

Step 5: Evaluate at $(t = 10)$ seconds

- Plug in $(t = 10)$:

$$s(10) = \frac{k}{m} \left(5 \times 100 - \frac{1000}{6} \right) = \frac{k}{m} \left(500 - \frac{1000}{6} \right)$$

$$s(10) = \frac{k}{m} \left(500 - 166.\overline{6} \right) = \frac{k}{m} \times 333.\overline{3}$$

- Simplify:

$$s(10) = \frac{k}{m} \left(500 - 166.\overline{6} \right) = \frac{k}{m} \times 333.\overline{3}$$

This provides the total displacement after 10 seconds.
