Working Principle of a People Counter Using Infrared Sensors

How the IR Break Beam Sensor Works

Infrared break beam sensors operate on a simple principle:

- The IR LED emits infrared light towards the photodiode or phototransistor.
- When unobstructed, the sensor detects the IR light and registers a 'beam intact.'
- If a person passes through the beam, they block the IR light, causing a drop in received IR signal.
- The Arduino detects this change and updates the counter accordingly.

Counting Logic

To accurately count people entering and exiting, two IR sensors are typically arranged in sequence:

- When a person crosses the first sensor (e.g., Entry), the system registers a 'person entering.'
- When the person passes the second sensor (e.g., Exit), the system registers a 'person leaving.'

Alternatively, some systems use a single sensor with timing logic or multiple sensors configured with specific thresholds to determine direction.

Step-by-Step Guide to Building a People Counter Using Arduino and Infrared Sensors

1. Wiring the Components

Begin by connecting the IR sensors to the Arduino:

- Connect the IR LED to a digital output pin (with a current-limiting resistor).
