- **Solution approach:** Recognize the pattern involves doubling each time; so, the next number is 32.

2. Arithmetic word problems

Word problems that require setting up equations or logical reasoning to find the answer.

- **Example:** A school has 480 students. If $\frac{3}{4}$ of them are girls, how many boys are there?
- **Solution approach:** Find the number of girls ($480 \times \frac{3}{4} = 360$), then subtract from total to find boys ($480 - 360 = 120$).

3. Geometry challenges

Problems involving shapes, angles, perimeters, areas, and volumes.

- **Example:** A triangle has angles of 35° and 65° . What is the measure of the third angle?
- **Solution approach:** Use the fact that the sum of angles in a triangle is 180° , so $180^\circ - (35^\circ + 65^\circ) = 80^\circ$.

4. Logical deduction and riddles

These puzzles develop reasoning skills and often have multiple steps.

- **Example:** There are three boxes: one contains apples, another contains oranges, and the third contains both apples and oranges. All boxes are labeled incorrectly. You may pick only one fruit from one box. How can you correctly label all boxes?
- **Solution approach:** Pick from the box labeled 'mixed'. Since the label is wrong, it contains only one type of fruit. Use this to relabel all boxes accordingly.

This question assesses understanding of arithmetic sequences, a fundamental concept in early algebra. It requires recognizing the pattern and applying the formula for the n th term: $(a_n = a_1 + (n-1)d)$.

Analysis:

The sequence is 2, 5, 8, 11, ...

Applying the formula: $(a_{10} = 2 + (10-1) \times 3 = 2 + 27 = 29.)$

The question is straightforward but reinforces the understanding of sequences.

Sample Question 2: Geometry and Spatial Reasoning

?A square has a side length of 4 cm. What is the area of the square??

Analysis:

A basic geometry question that tests knowledge of area calculation: $(\text{Area} = \text{side}^2)$.

Solution: $(4 \text{ cm} \times 4 \text{ cm} = 16 \text{ cm}^2.)$

While simple, such questions serve as foundational skills.

Sample Question 3: Word Problem

A basket contains red, blue, and green apples. There are twice as many red apples as green apples, and the total number of apples is 18. If there are 4 blue apples, how many red apples are there??

Analysis:

This problem involves setting up algebraic equations.

Let g = number of green apples, then red apples = $2g$.

Total apples: $2g + g + 4 = 18$.

Simplify: $3g + 4 = 18 \rightarrow 3g = 14 \rightarrow g = \frac{14}{3}$, which is not an integer, indicating a potential trick or an approximation in the problem.

In actual contest settings, questions are designed so that solutions are integral, emphasizing careful problem reading.
