- c) The load resistance

d) The supply frequency

Answer: b) The firing angle (?)

Explanation:

The average output voltage of a controlled rectifier depends primarily on the firing angle, which determines when the thyristors are triggered within the AC cycle. By adjusting α , the output voltage can be controlled from zero up to nearly the peak input voltage, enabling precise power regulation.

Question 3: Which of the following is a key advantage of a buck converter?

- Rectifier circuit analysis
- Inverter circuit analysis
- Chopper circuit analysis
- Switching power supplies
- Control and regulation problems

Below, we present detailed solutions to representative problems from each category.

Solved Examples in Power Electronics

Example 1: Single-Phase Half-Wave Rectifier

Problem:

Calculate the average load voltage and the ripple factor for a single-phase half-wave rectifier with a peak input voltage of 100 V and a resistive load of 1 k Ω . Assume ideal diode operation.

Solution:

- Determine Peak Voltage (V_m):

Given: $V_m = 100 \text{ V}$

- Calculate Average Output Voltage (V_{avg}):

For a half-wave rectifier with an ideal diode:

$$V_{avg} = (V_m / \pi)$$

$$V_{avg} = 100 / \pi \approx 31.83 \text{ V}$$

- Calculate RMS Output Voltage (V_{rms}):

$$V_{rms} = V_m / \sqrt{2} = 100 / \sqrt{2} = 70.71 \text{ V}$$

- Find Ripple Factor (?):

Ripple factor is given by:

$$r = V_{\text{ripple}} / V_{\text{avg}}$$

For a half-wave rectifier, ripple voltage (V_{ripple}) is approximately:

$$V_{\text{ripple}} \approx V_m / \pi$$

But more precisely, ripple factor for half-wave rectifier:

$$r = (V_{\text{rms}} / V_{\text{avg}}) - 1 \approx (50 / 31.83) - 1 \approx 1.57 - 1 = 0.57$$

Answer:

- Average load voltage ≈ 31.83 V
- Ripple factor ≈ 0.57

Example 2: Full-Bridge Inverter Output Voltage

Problem:

A single-phase full-bridge inverter supplies a resistive load of 10Ω with a peak output voltage of 200 V. Calculate the RMS output voltage and the fundamental component of the output assuming ideal switching.

Solution:

- Peak Output Voltage (V_{peak}):

$$V_{\text{peak}} = 200 \text{ V}$$

- RMS Output Voltage (V_{rms}):

For a square wave inverter with 50% duty cycle:

$$V_{\text{rms}} = V_{\text{peak}} / \sqrt{2} \approx 200 / 1.414 \approx 141.42 \text{ V}$$

- Fundamental Component (V1):

The fundamental component of a square wave is:

$$V_1 = (4 \times V_{\text{peak}}) / \pi = (4 \times 200) / 3.1416 = 254.65 \text{ V}$$

Answer:

- RMS output voltage = 141.42 V
- Fundamental component of output voltage = 254.65 V

Example 3: Buck Converter Design

Problem:

Design a buck converter to step down a 48 V input voltage to 12 V at a load current of 3 A. Assume the converter operates at a switching frequency of 100 kHz, with a inductor ripple current of 20% of the load current. Calculate the required inductor value.

Solution:

- Given Data:

$$V_{\text{in}} = 48 \text{ V}$$

$$V_{\text{out}} = 12 \text{ V}$$

$$I_{\text{load}} = 3 \text{ A}$$

$$\text{Switching frequency, } f = 100 \text{ kHz} = 100,000 \text{ Hz}$$

$$\text{Ripple current, } \Delta I_L = 20\% \text{ of } I_{\text{load}} = 0.2 \times 3 = 0.6 \text{ A}$$

- Calculate the duty cycle (D):

$$D = V_{\text{out}} / V_{\text{in}} = 12 / 48 = 0.25$$

- Determine inductor (L):

$$L = (V_{in} - V_{out}) \times D / (\Delta I_L \times f)$$

$$L = (48 - 12) \times 0.25 / (0.6 \times 100,000)$$

$$L = 36 \times 0.25 / 60,000$$

$$L = 9 / 60,000$$

$$L \approx 150 \mu H$$

Answer:

The required inductor value is approximately 150 μH .

Example 4: Thyristor-Based Phase-Controlled Rectifier

Problem:

A single-phase full-controlled rectifier with silicon-controlled rectifiers (SCRs) supplies a load of 200 Ω from an AC supply of 230 V (rms, 50 Hz). Determine the average load voltage when the firing angle (α) is set to 60°.

Solution:

- Convert Supply Voltage to Peak Voltage:

$$V_m = \sqrt{2} \times V_{rms} = 1.414 \times 230 \approx 325 \text{ V}$$

- Calculate Average Load Voltage (V_{avg}):

$$V_{avg} = (V_m / \pi) \times (1 + \cos \alpha)$$

Convert α to radians: $\alpha = 60^\circ = \pi/3$ radians

- Compute $\cos \alpha$:

$$\cos(60^\circ) = 0.5$$

- Calculate V_{avg} :

$$V_{avg} = (325 / \pi) \times (1 + 0.5) - (325 / 3.1416) \times 1.5 - 103.5 \times 1.5 - 155.25 \text{ V}$$

Answer:

Solved examples serve multiple purposes: they clarify theoretical concepts, demonstrate practical problem-solving techniques, and provide templates for approaching new challenges. This review covers a range of typical problems encountered in power electronics, including rectifiers, inverters, choppers, and switching regulators.

Fundamental Solved Examples in Power Electronics

Example 1: Single-Phase Fully Rectifier with a Resistive Load

Problem Statement:

Calculate the average output voltage and the ripple factor for a single-phase fully rectified supply with a 230V RMS AC input and a resistive load of 100?

Solution Approach:

- Input parameters:

- RMS voltage, $(V_{rms} = 230\text{V})$

- Peak voltage, $(V_{peak} = V_{rms} \times \sqrt{2} \approx 325.3\text{V})$

- Output voltage characteristics:

For a fully rectified sine wave, the average output voltage, (V_{dc}) , is:

[

$$V_{dc} = \frac{2V_{peak}}{\pi} \approx \frac{2 \times 325.3}{\pi} \approx 207\text{V}$$

]

- Ripple factor:

Ripple factor, (r) , for a full-wave rectifier with a resistive load is:

$$\sqrt{V_{\text{rms,load}}^2 - V_{\text{dc}}^2}$$

$$r = \frac{\sqrt{V_{\text{rms,load}}^2 - V_{\text{dc}}^2}}{V_{\text{dc}}}$$

$$\sqrt{V_{\text{rms,load}}^2 - V_{\text{dc}}^2}$$

Since the load is purely resistive, the load current, $I_{\text{load}} = V_{\text{dc}}/R \approx 2.07\text{A}$. The RMS output voltage is approximately:

$$\sqrt{V_{\text{rms,load}}^2 - V_{\text{dc}}^2}$$

$$V_{\text{rms,load}} = V_{\text{peak}} / \sqrt{2} \approx 230\text{V}$$

$$\sqrt{V_{\text{rms,load}}^2 - V_{\text{dc}}^2}$$

Calculating ripple factor yields approximately 0.48, indicating moderate ripple.

Conclusion:

This example demonstrates calculating average output voltage and ripple factor in a simple rectifier circuit, foundational for understanding power supply design.

Example 2: Design of a Buck Converter for a Specific Output

Problem Statement:

Design a buck converter to deliver 12V output at 3A, with input voltage varying from 15V to 20V. Select appropriate inductance and switching frequency to ensure a ripple voltage of less than 0.2V.

Solution Approach:

- Determine duty cycle range:

$$D_{\text{max}} = \frac{V_{\text{out}}}{V_{\text{in}_{\text{min}}}} = \frac{12}{15} = 0.8$$

$$D_{\text{max}} = \frac{V_{\text{out}}}{V_{\text{in}_{\text{min}}}} = \frac{12}{15} = 0.8$$

$$D_{\text{min}} = \frac{V_{\text{out}}}{V_{\text{in}_{\text{max}}}} = \frac{12}{20} = 0.6$$

$$D_{\text{min}} = \frac{V_{\text{out}}}{V_{\text{in}_{\text{max}}}} = \frac{12}{20} = 0.6$$

$$D_{\min} = \frac{12}{20} = 0.6$$

\\

- Inductor selection:

Using the ripple current, (ΔI_L) , typically 20-40% of load current:

\\

$$\Delta I_L = 0.3 \times 3\text{A} = 0.9\text{A}$$

\\

- Switching frequency:

To minimize size and switching losses, select $(f_s = 100\text{kHz})$.

- Calculating inductance:

\\

$$L = \frac{V_{\text{in}_{\min}} \times D_{\max} \times (1 - D_{\max})}{f_s \times \Delta I_L} \approx \frac{15 \times 0.8 \times 0.2}{100,000 \times 0.9} \approx 26.67\text{ }\mu\text{H}$$

\\

- Output voltage ripple:

\\

$$\Delta V_{\text{out}} = \frac{\Delta I_L \times D}{f_s \times C}$$

\\

To keep ripple below 0.2V, select a capacitor (C) accordingly (e.g., 100?F).

Conclusion:

This example illustrates the systematic approach to designing a buck converter, including duty cycle calculation, inductance, and capacitor selection, ensuring specifications are met across varying input voltages.

Advanced Power Electronics Problems and Solutions

Example 3: Three-Phase Inverter Switching Pattern Analysis

Problem Statement:

Determine the switching states for a three-phase inverter operating in a six-step PWM mode to generate a balanced three-phase AC output of 400V line-to-line RMS, given DC bus voltage of 600V.

Solution Approach:

- Understanding inverter switching states:

The inverter has 8 possible switching states, but for six-step operation, six are used to synthesize the AC wave.

- Switching sequence:

The sequence of switching states for each inverter leg is designed to produce a specific phase voltage pattern. For example, in one cycle:

- State 1: $(S_A, S_B, S_C) = (1, 0, 1)$
- State 2: $(1, 0, 0)$
- State 3: $(1, 1, 0)$
- State 4: $(0, 1, 0)$
- State 5: $(0, 1, 1)$
- State 6: $(0, 0, 1)$

- Resultant phase voltages:

Each state produces a specific phase voltage relative to the inverter's midpoint, leading to a line-to-line RMS voltage of approximately:

\[

$$V_{L-L} = \frac{V_{DC}}{\sqrt{3}} \approx 346\text{V}$$

\]

which is consistent with the specified 400V RMS line-to-line voltage when considering modulation index and filtering.

Conclusion:

This detailed switching pattern analysis confirms the inverter's ability to generate desired AC waveforms and illustrates the importance of switching sequence design to achieve desired output parameters.

Example 4: Pulse Width Modulation (PWM) for Voltage Control

Problem Statement:

Design a sinusoidal PWM scheme to control the inverter output voltage at 50% of the maximum (i.e., modulation index $m=0.5$), with a carrier frequency of 1kHz, for a 3-phase inverter with 600V DC bus.

Solution Approach:

- Determine the reference and carrier signals:
- Reference sinusoid: $V_{ref} = m \times V_{DC}/2 \times \sin(\omega t)$
- Carrier signal: triangular wave of 1kHz
- PWM switching logic:

Each switch is turned ON when the reference signal exceeds the triangular carrier wave, producing a modulated output voltage.

- Output voltage calculation:

The fundamental component of the inverter output voltage is:

$$V_{\text{fund}}$$

$$V_{\text{fund}} = \frac{m \times V_{\text{DC}}}{2} \approx 150 \text{ V}$$

$$V_{\text{L-L}}$$

Thus, the RMS line-to-line voltage is approximately $V_{\text{L-L}} = \sqrt{3} \times V_{\text{phase}} \approx 260 \text{ V}$.

Conclusion:

This example demonstrates the design of PWM schemes for voltage regulation, emphasizing the relationship between modulation index, switching frequency, and output voltage.
