Producers, such as plants and algae, convert sunlight into energy through photosynthesis, forming the foundation of the food chain in the biosphere. How does Chapter 3 address the concept of biogeochemical cycles? It explains how elements like carbon, nitrogen, and water cycle through the biosphere, atmosphere, lithosphere, and hydrosphere, maintaining ecological balance. What are some human impacts on the biosphere covered in Chapter 3? Human activities such as deforestation, pollution, and climate change significantly alter natural processes and threaten biodiversity within the biosphere. How does Chapter 3 describe the importance of biodiversity in the biosphere? Biodiversity is vital for ecosystem stability, resilience, and providing essential resources, highlighting the need for conservation efforts. What are the key factors influencing the distribution of organisms in the biosphere as per Chapter 3? Factors include climate, availability of resources, competition, and interactions with other species, which determine where organisms can survive and thrive. How does Chapter 3 explain the concept of ecological succession within the biosphere? Ecological succession is described as the gradual process of change in species composition in an ecosystem over time, leading to a stable climax community.
