Sean Parsons, a Certified Pharmacy Technician (CPHT), has made significant contributions to education in this field, emphasizing clarity, accuracy, and practical application.

Understanding his methods involves grasping fundamental concepts such as units of measurement, conversions, ratios, proportions, and the specific calculations used in pharmacy practice.

The Foundations of Sean Parsons' Approach

Emphasis on Clear Conceptual Understanding

Sean Parsons advocates for a solid grasp of basic mathematical principles rather than rote memorization. His approach stresses understanding why a calculation works, which enhances accuracy and confidence.

Step-by-Step Methodology

He promotes breaking down complex calculations into smaller, manageable steps. This systematic approach helps prevent errors and makes even challenging problems approachable.

Use of Standardized Formulas and Conversions

Sean Parsons encourages familiarity with essential formulas and conversion factors. Mastery of these tools allows for quick, accurate calculations across various pharmaceutical contexts.

Core Topics in Pharmaceutical Calculations

- Units of Measurement and Conversions

A foundational aspect of pharmaceutical calculations involves understanding and converting between different units.

Common Units in Pharmacy

- Weight: grams (g), milligrams (mg), micrograms (mcg)
- Volume: liters (L), milliliters (mL), microliters (µL)
- Length: meters (m), centimeters (cm), millimeters (mm)
- Time: hours, minutes, seconds

Conversion Factors

- 1 g = 1000 mg
- 1 mg = 1000 mcg
- 1 L = 1000 mL
- 1 mL = 1 cc (cubic centimeter)

Tip: Always double-check unit conversions, especially when switching between weight and volume, as they are not interchangeable without proper density information.

- Ratios and Proportions

Ratios and proportions form the basis for many calculations, such as dilutions, concentrations, and dosage calculations.

How to Set Up Ratios and Proportions

- Identify known quantities and what you need to find.
- Set up the ratio or proportion accordingly.
- Cross-multiply to solve for the unknown.

Example:

If 10 mL of a solution contains 50 mg of drug, how much drug is in 25 mL?

- Set up ratio: $10 \text{ mL} / 50 \text{ mg} = 25 \text{ mL} / x$

- Cross-multiplied: $10x = 25 \times 50$
- Calculate: $10x = 1250$
- $x = 125 \text{ mg}$

- Dosage Calculations

Proper dosage calculations are critical for patient safety.

Types of Dosage Calculations

- Dose calculations based on weight/body surface area
- Percentage solutions
- Concentrations (e.g., mg/mL)
- Infusion rates

Common Formulae:

- $\text{Dose (mg)} = \text{Dose prescribed (mg/kg)} \times \text{Patient weight (kg)}$
- $\text{Volume to administer} = \text{Dose (mg)} / \text{Concentration (mg/mL)}$

Practical Calculation Techniques from Sean Parsons

- Working with Concentrations

Understanding how to manipulate concentration data is essential.

- Example: To prepare a solution:
 - Desired concentration: 50 mg/mL
 - Amount needed: 250 mg
 - $\text{Volume needed} = 250 \text{ mg} / 50 \text{ mg/mL} = 5 \text{ mL}$

- Dilutions

Dilution calculations are common when preparing solutions from concentrated stock.

- Formula: $C_1V_1 = C_2V_2$

- C_1 = initial concentration
- V_1 = volume of stock solution needed
- C_2 = desired concentration
- V_2 = final volume

Example:

Prepare 100 mL of a 10 mg/mL solution from a stock that is 100 mg/mL.

$$- V_1 = (C_2 \times V_2) / C_1 = (10 \text{ mg/mL} \times 100 \text{ mL}) / 100 \text{ mg/mL} = 10 \text{ mL}$$

- Take 10 mL of stock and dilute to 100 mL total volume.

- Calculating Infusion Rates

Infusion calculations are vital in hospital pharmacy.

- Formula: Infusion rate (mL/hr) = (Dose in mg / Time in hours) / Concentration (mg/mL)

Example:

Administer 500 mg over 4 hours with a solution concentration of 50 mg/mL.

$$- \text{Infusion rate} = (500 \text{ mg} / 4 \text{ hr}) / 50 \text{ mg/mL} = (125 \text{ mg/hr}) / 50 \text{ mg/mL} = 2.5 \text{ mL/hr}$$

Strategies for Success in Pharmaceutical Calculations

Total volume = 1000 mL

Time = 8 hours

- Step 2: Calculation

Flow rate (mL/hour) = Total volume / Time

- Step 3: Compute

$$\text{Flow rate} = 1000 \text{ mL} / 8 \text{ hours} = 125 \text{ mL/hour}$$

Answer:

Set IV infusion at 125 mL/hour.

Example 3: Calculating Body Surface Area (BSA)

Scenario:

A patient weighs 70 kg and is 175 cm tall. Calculate their BSA using the Mosteller formula:

$$\sqrt{\text{BSA (m}^2\text{)} = \sqrt{\frac{\text{height(cm)} \times \text{weight(kg)}}{3600}}}$$

Solution:

- Step 1: Plug in values

$$\text{BSA} = \sqrt{(175 \times 70) / 3600}$$

- Step 2: Calculate numerator

$$175 \times 70 = 12,250$$

- Step 3: Divide by 3600

$$12,250 / 3600 = 3.4028$$

- Step 2: Determine volume to administer:

$$\begin{aligned} & \left[\right. \\ & \frac{350\, \text{mg}}{100\, \text{mg/mL}} = 3.5\, \text{mL} \\ & \left. \right] \end{aligned}$$

Result: Administer 3.5 mL of the medication.

Tip: Use a calculator or app to perform these calculations swiftly, and always verify units.

Example 2: IV Flow Rate Calculation

Problem:

A nurse needs to infuse 1,000 mL of IV fluid over 8 hours. What is the flow rate in mL/hr?

Solution:

\[

$$\frac{1000 \text{ mL}}{8 \text{ hr}} = 125 \text{ mL/hr}$$

\]

Result: Set the IV infusion pump to 125 mL/hr.

Additional Tip: For manual infusion, calculate drops per minute if using a drop factor (e.g., 20 drops/mL):

\[

$$\text{Drops/min} = \frac{\text{Flow rate (mL/hr)} \times \text{Drop factor}}{60}$$

\]
