- Planning wiring routes and power sources

This phase minimizes surprises during installation and ensures optimal system performance.

Hardware Installation

The hardware components generally include:

- Main Processing Unit (MPU): Central controller managing data processing
- Display Panels: Touchscreens or multi-function displays
- Sensor Modules: Interfaces with existing aircraft sensors
- Wiring Harnesses: For power and data connections
- External Modules: Additional sensors or antennas as needed

Installation involves mounting displays, routing wiring, and connecting sensors, often requiring removal of panels and careful handling of delicate components.

Software Configuration and Calibration

Post hardware installation, the system requires:

- Firmware updates
- Calibration of sensors
- Customization of dashboards and alert thresholds
- Integration with existing avionics systems

This step ensures that the system operates seamlessly within the aircraft's environment.

Testing and Certification

Thorough testing follows installation:

- System diagnostics to verify hardware functionality
- Flight testing to calibrate sensors and validate data accuracy
- Compliance checks with aviation authority standards (e.g., FAA, EASA)

Proper documentation and certification are crucial for operational approval.
