Introduction to Thermodynamics

Thermodynamics is the branch of physics that deals with heat, work, and energy transfer. It is fundamental in engineering disciplines, especially mechanical, chemical, and aerospace engineering, as it governs the behavior of systems involving energy transformations.

Basic Concepts and Definitions

- System and Surroundings: The system is the part of the universe under study, while surroundings are everything outside the system.
- Types of Systems:
 - Open System: exchanges both energy and mass with surroundings.
 - Closed System: exchanges energy but not mass.
 - Isolated System: exchanges neither energy nor mass.
- Properties of a System:
 - Extensive properties (depend on size): volume, mass, total energy.
 - Intensive properties (independent of size): temperature, pressure, density.
- State and Process:
 - State: defined by properties at a specific moment.
 - Process: a change from one state to another.

Thermodynamic Laws Discussed in the 6th Edition

Understanding the fundamental laws is crucial for solving thermodynamic problems.

First Law of Thermodynamics

- Conservation of energy principle.
- Mathematically: $\Delta U = Q - W$
- ΔU : change in internal energy
- Q : heat added to the system
- W : work done by the system

Second Law of Thermodynamics

- Addresses the direction of processes and entropy.
- Entropy (S) always tends to increase in an isolated system.
- Kelvin-Planck statement: No process is possible whose sole result is the absorption of heat from a reservoir and its conversion into work.

Third Law of Thermodynamics

- As temperature approaches absolute zero, the entropy of a perfect crystal approaches zero.

Additional Laws and Concepts

- Zeroth Law: thermal equilibrium implies equal temperatures.
- Carnot cycle and efficiency.
- Concepts of reversible and irreversible processes.

Thermodynamic Properties and Equations

The textbook emphasizes the importance of property tables, equations of state, and equations for specific processes.

Property Tables and Charts

- Steam Tables: provide properties of water and steam.

Sample Problem and Solution from Faires

Problem: A piston-cylinder device contains 0.5 kg of water at 200°C and 800 kPa. The water is heated at constant pressure until it becomes saturated vapor. Determine the heat added during this process.

Solution Steps:

- Identify the process: constant pressure heating from superheated water to saturated vapor.
- Find initial state properties:
 - From the superheated steam table at 800 kPa and 200°C:
 - Specific volume, v ?
 - Internal energy, u ?
- Determine the final state:
 - At 800 kPa, saturated vapor:
 - Specific volume, $v = v_g$ at 800 kPa
 - Internal energy, $u = u_g$ at 800 kPa
- Calculate the heat added:
 - $Q = m(u - u_1)$

Using property tables:

- At 800 kPa,
 - $u_g = 2675$ kJ/kg
 - $v_g = 0.8857$ m³/kg
- At 200°C (superheated),
 - $u = 2584$ kJ/kg (from superheated tables)
 - $v = 0.8857$ m³/kg (approximate, since it's superheated vapor)

Calculations:

- Total internal energy change:

$$Q = m(u - u_1) = 0.5 \text{ kg} (2675 - 2584) \text{ kJ/kg} = 0.5 \times 91 = 45.5 \text{ kJ}$$

Answer: Approximately 45.5 kJ of heat is added during the process.

How to Utilize Solutions Effectively

- Understand the solution steps: don't just memorize; grasp the reasoning.
- Practice similar problems: to reinforce concepts.
- Note common assumptions: steady flow, idealizations, boundary conditions.
- Check units and magnitudes: to ensure correctness.
- Use the solutions as a guide, then try solving similar problems independently.

Additional Tips for Mastering Thermodynamics with Faires

- Familiarize yourself with property tables: knowing where and how to extract data is vital.
- Visualize processes: sketch P-V, T-S diagrams.
- Understand the physical meaning behind equations.
- Practice problem variation: different boundary conditions, process types.
- Review solved examples regularly to build problem-solving intuition.
