What Is Probability?

Probability measures the likelihood of an event occurring within a defined sample space. It is expressed as a value between 0 and 1, where 0 indicates impossibility and 1 denotes certainty. For example, the probability of a circuit failing under certain stress conditions might be 0.05, indicating a 5% chance of failure.

Fundamental Concepts of Probability

- Sample Space (S): The set of all possible outcomes of an experiment or process.
- Event (E): A subset of the sample space, representing outcomes of interest.
- Probability of an Event (P(E)): The measure of the likelihood that event E occurs.

Key axioms and properties:

- Non-negativity: $P(E) \geq 0$
- Normalization: $P(S) = 1$
- Additivity: For mutually exclusive events E1 and E2, $P(E1 \cup E2) = P(E1) + P(E2)$

Statistical Fundamentals in Engineering

While probability deals with modeling uncertainty, statistics focuses on analyzing data to infer properties about a population or process.

Descriptive Statistics

- Mean (Expected Value): The average outcome or central tendency.
- Variance and Standard Deviation: Measures of data dispersion, indicating the variability within data sets.
- Skewness and Kurtosis: Descriptions of data asymmetry and tail heaviness.

Inferential Statistics

- Hypothesis Testing: Assessing assumptions about a population parameter based on sample data.

Key Concepts in Random Processes

- Autocorrelation Function: Measures how the process correlates with itself over time lag, critical for understanding dependencies.
- Power Spectral Density: Describes the distribution of power or variance across different frequency components.
- Markov Processes: Processes with no memory; future states depend solely on the present state.

- Poisson Processes: Model random events occurring independently over time, useful in queuing and network modeling.
