"If $(x + y = 10)$ and $(xy = 21)$, what is the value of $(x^2 + y^2)$?"

Answer Choices:

A) 29

C) 72

D) 84

$$(10)^2 - 2 \times 21 = 100 - 42 = 58$$

- Since 58 isn't listed, recheck calculations; perhaps the identity is misapplied or options are approximate.

Re-evaluation:

- Wait, the options suggest an approximate or different approach. Alternatively, if options are approximate, none match exactly, indicating perhaps a misinterpretation.

Conclusion:

- The correct calculation yields 58, which isn't an option?this suggests a need to double-check the question or consider that the provided options are approximate or testing understanding of identities.

This example underscores the importance of understanding identities and carefully verifying solutions when analyzing answer choices.
